

# Week 7: For Loops

Samira & Sophie, 2023

*Adapted from Elena & Willa, 2022*

# Who are we?

Sophie!  
3rd year, Dev  
Language and Cognitive  
Development Lab  
sophie\_regan@berkeley.edu

**Samira** (she/they)

4th year, Neuroscience (Cog Neuro)  
Jagust & Weiner labs  
smaboudian@berkeley.edu

# Today's agenda

Intros + Warm-up

For loops slides & demo

Practice problems

# What is a *loop*? What is a ***for*** loop for?

Loop - the action of doing something over and over again

**For Loop** - type of loop that has a pre-specified beginning and end; used when you want to repeat an action a certain number of times

Examples:

- “Set the table for 4 people”
- Send an invitation to everyone on a guest list
- Add one point to the grade of every student in your class

# Example: Imagine you're giving instructions to someone who has never set a table before for 4

Do this 4 times:

- Put out placemat
- Put out plate
- Put out napkin
- Place fork on napkin on left side
- Place knife then spoon on right side of the plate
- Put glass on right side of placemat

# Guest list example

I'm having a Halloween party. I need to make a guest list and send text messages to everyone to invite them.

I could do a group text, but I figured it would be more personal to send individual messages.

```
guest_list = Willa, Samira, Elena, Sophie
```

That's it for now. I can always add more people later.

```
guest_list = Willa, Samira, Elena, Sophie
```

Now that I have my list, I'm going to write my message:

```
message = "hi [guest]! I'm having a Halloween Party on 10/31! The  
party starts at 9pm. I hope to see you there!"
```

Sweet! Now that I have my guest list and message, I'm ready to start sending text invites **to each person on the guest list.**

To Willa: send(message)

To Samira: send(message)

To Elena: send(message)

... etc.

For each person on the guest list:  
send(message)

# Goal:

sent

To: **345-943-0876**,  
Hi **Willa**! I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!

To: **206-738-9942**,  
Hi **Elena**! I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!

To: **548-224-0381**,  
Hi **Samira**! I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!

# Anatomy of a for loop

```
for (i in "some range") {  
  
    "do something"  
  
}
```

# Anatomy of a for loop

*index/iterator.  
Exists in the scope of the loop*

```
for (i in "some range") {  
  
    "do something"  
  
}
```

# Anatomy of a for loop

*What are you iterating over?*

- *A list of participants?*
- *A range of numbers?*

```
for (i in "some range") {  
  
    "do something"  
  
}
```

# Anatomy of a for loop

*What are you iterating over?*

- *A list of participants?*
- *A range of numbers?*

```
for (i in "some range") {
```

```
  "do something"
```

*What a values should "i" take??*

```
}
```

# Anatomy of a for loop

*What are you iterating over?*

- A list of participants?
- A range of numbers?

```
for (i in "some range") {
```

```
"do something"
```

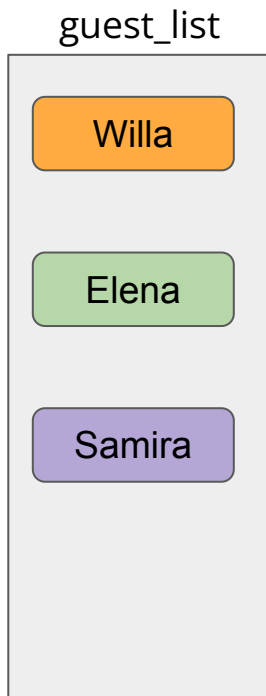

*What a values should "i" take??*

```
}
```

*What do you want to do in the loop?*

- Multiply "i" by another value
- Combine with another string?
- Save a new variable?

# The logic of for loops

*length(guest\_list) = 3, so loop stops at i = 3*

*→ generally, you should use `1:length(guest_list)` here instead of `1:3`  
in case your list length changes (you add/remove guests)*

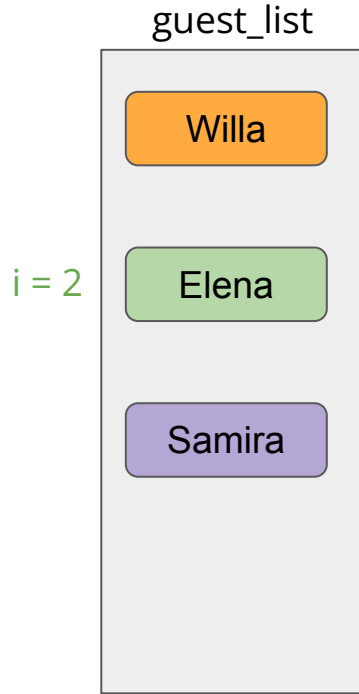

```
for (i in 1:3) {  
  print(guest_list[i])  
}
```

# The logic of for loops

```
for (i in 1:3) {  
  print(guest_list[i])  
}
```

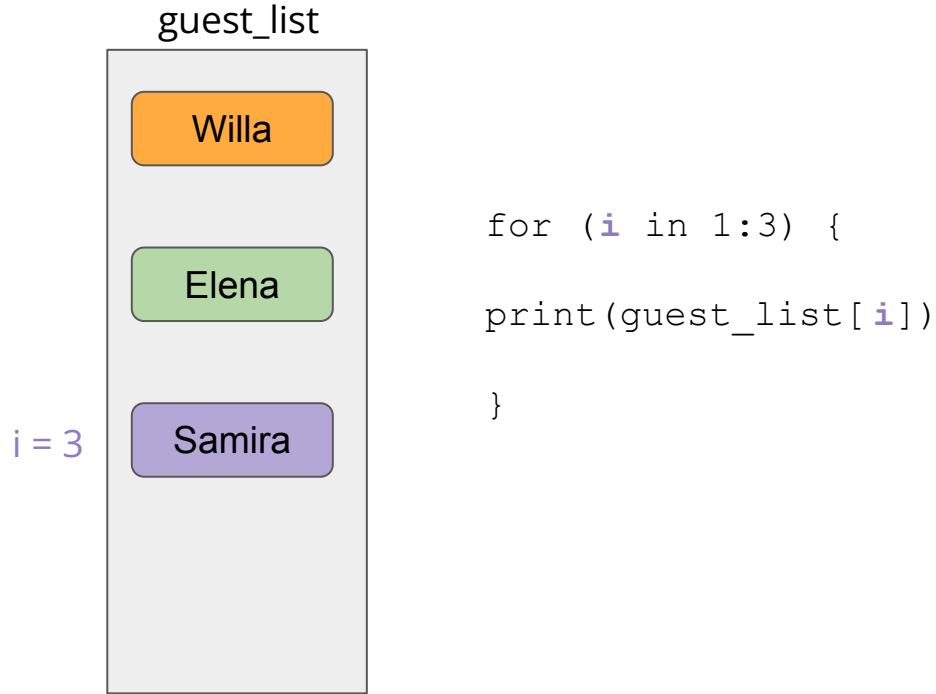

# The logic of for loops

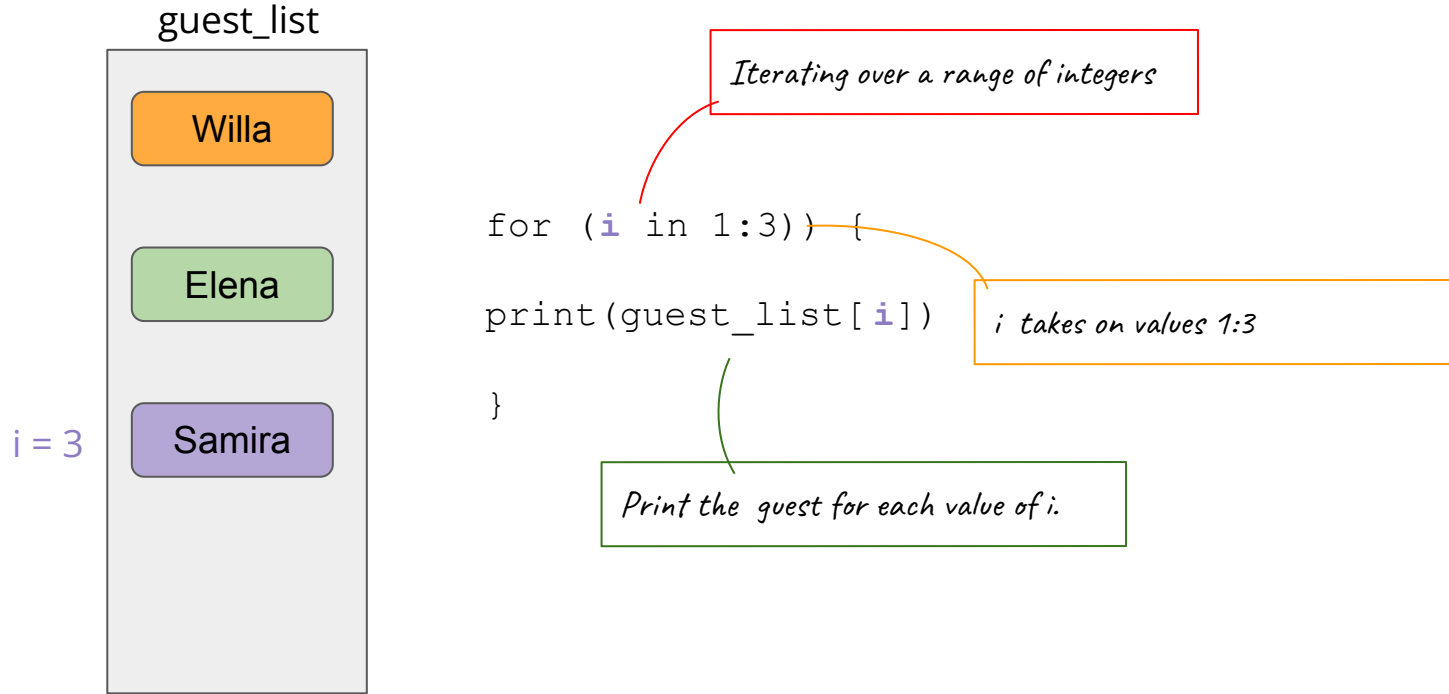

```
for (i in 1:3) {  
  print(guest_list[i])  
}
```

# The logic of for loops

# The logic of for loops

# Let's use this idea to write a personalized message

Willa

Elena

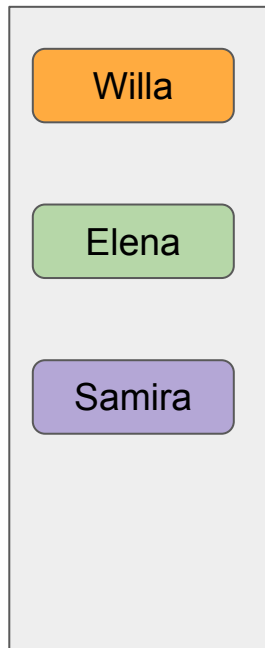

Samira

Print a message that says "hi <guest name>. "I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!"

What needs to change each time?

What stays the same?

# Let's use this idea to write a personalized message

Print a message that says "hi **<guest name>**. "I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!"

*iterate over guest list*

*The message stays the same*

# We can use indexing to personalize the message

Willa

Elena

Samira

```
message = "I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!"
```

```
for (i in 1:3) {  
  
  print(paste0("hi", guest_list[i], "message"))  
  
}
```

# We can use indexing to personalize the message

i = 1

Willa

Elena

Samira

```
message = "I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!"
```

```
for (i in 1:3) {  
  
  print(paste0("hi", guest_list[i], message"))  
  
}
```

Hi **Willa**! I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!

# We can use indexing to personalize the message

`i = 2`

Willa

Elena

Samira

```
message = "I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!"
```

```
for (i in 1:3) {  
  
  print(paste0("hi", guest_list[i], message"))  
  
}
```

Hi **Elena**! I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!

# We can use indexing to personalize the message

i = 3

Willa

Elena

Samira

```
message = "I'm having a Halloween Party on 10/31!  
The party starts at 9pm. I hope to see you there!"
```

```
for (i in 1:3) {  
  
  print(paste0("hi", guest_list[i], message"))  
  
}
```

Hi **Samira**! I'm having a Halloween Party on 10/31! The party starts at 9pm. I hope to see you there!

The concept of *indexing* allows us to include information from more vectors

guest_list	phone_no
Willa	345-943-0876
Elena	206-738-9942
Samira	548-224-0381

The concept of *indexing* allows us to include information from more vectors

# We can also use indexing to save the output to a new vector

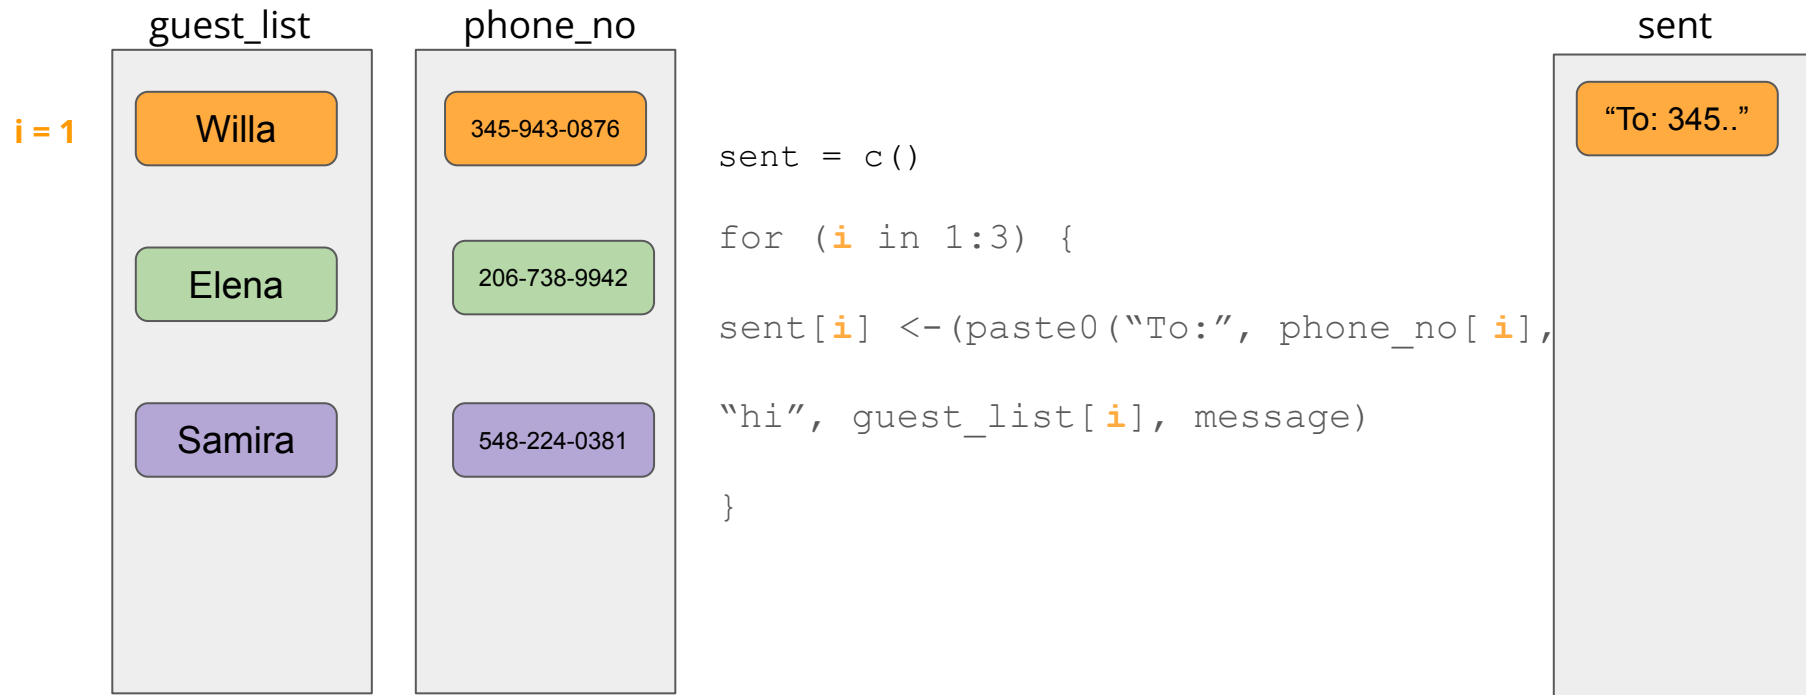

# We can also use indexing to save the output to a new vector

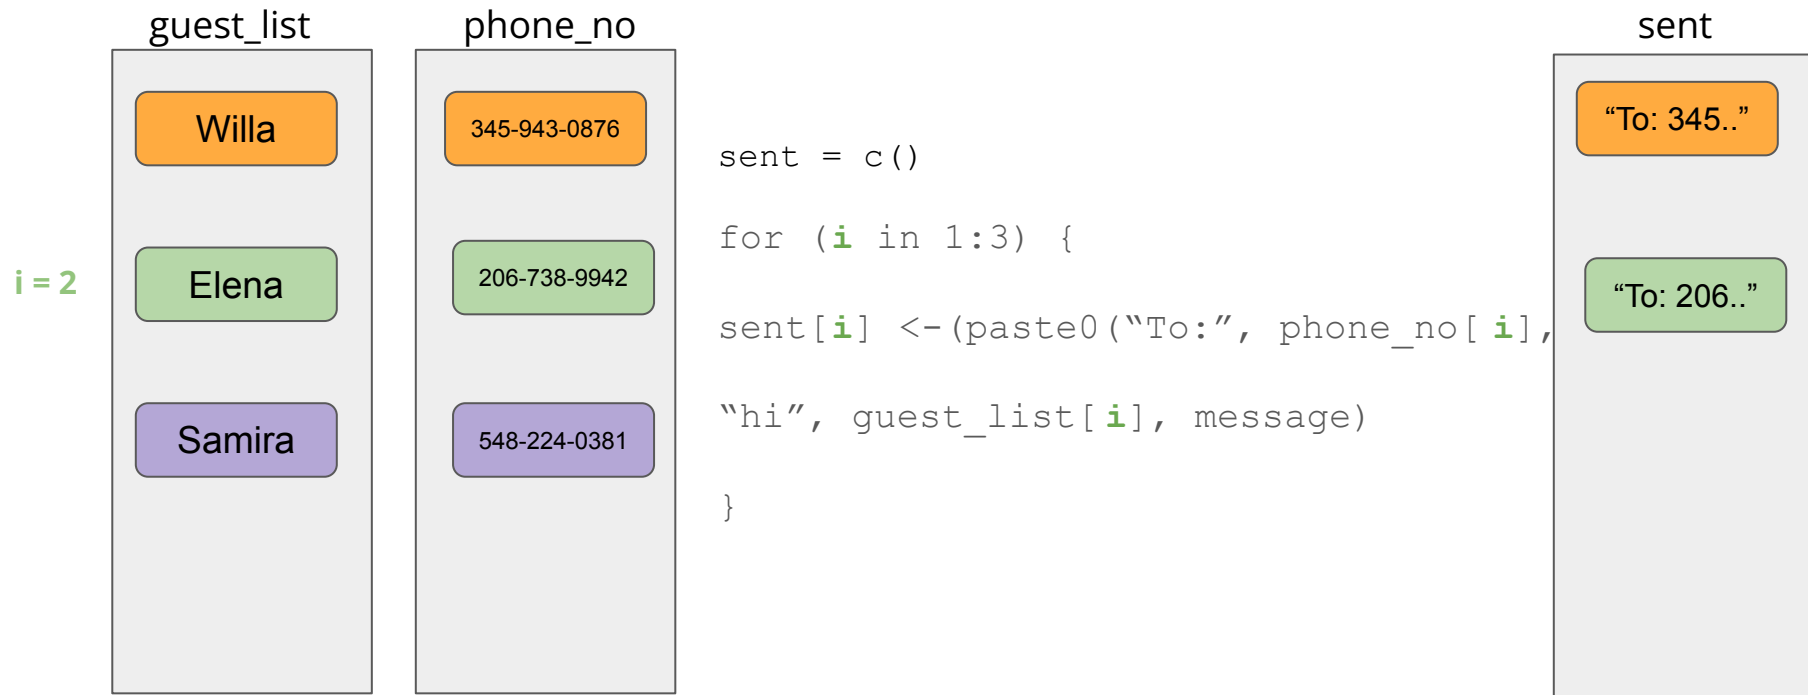

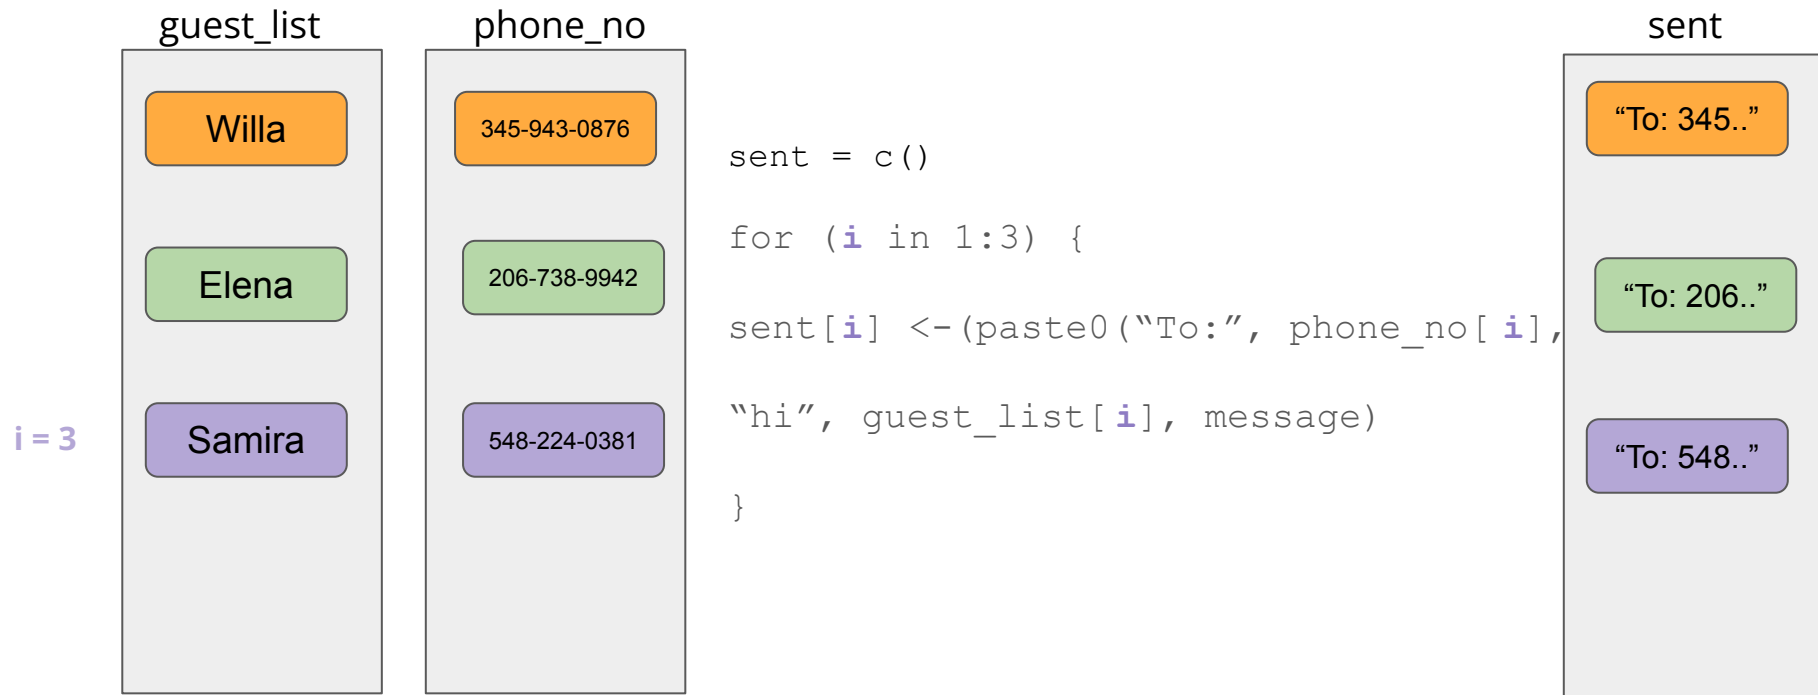

# We can also use indexing to save the output to a new vector

# We can also use indexing to save the output to a new vector

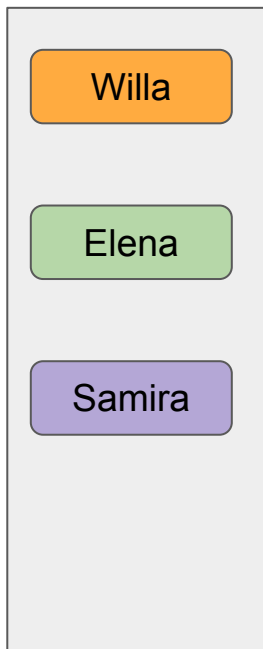

# We can also use indexing to save the output to a new vector

“ i “ is the standard we use for indexing,  
but you can use anything that makes sense to you.

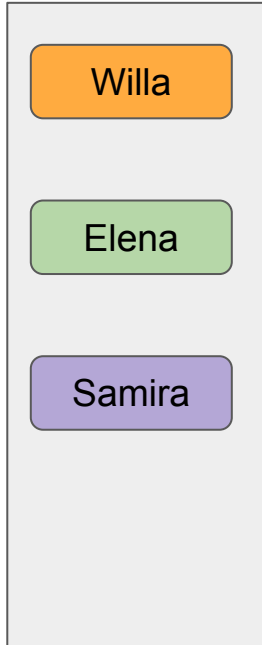

guest\_number =1

```
for (guest_num in 1:3) (  
  print(guest_list[guest_num])  
)
```

When we only have one vector we can use an even simpler syntax: loop through the elements instead of the index

guest

```
for (guest in guest_list) (  
  print(guest)  
)
```

# Anatomy of a for loop

*What are you iterating over?*

- A list of participants?
- A range of numbers?

```
